The 3 Phases of H₂O

➤ ice

➤ water

➤ water vapor

← solid

← liquid

← gas

any phase change costs or releases energy

The diagram shows a triangle with vertices labeled 'ice' (bottom left), 'water' (bottom right), and 'water vapor' (top). The transitions are as follows:

- Ice to Water Vapor: sublimation (endothermic), 2848 J
- Water Vapor to Ice: deposition (exothermic), 2848 J
- Water to Water Vapor: evaporation (endothermic), 2257 J
- Water Vapor to Water: condensation (exothermic), 2257 J
- Ice to Water: melting (endothermic), 334 J
- Water to Ice: freezing (exothermic), 334 J

Fig. 2.12

SIO15 2024: Topic 03 - The Solar System

7

Latent Heat, Evaporation and Condensation

evaporation:
water vapor absorbs heat

condensation:
water vapor releases heat

it takes 600 cal to evaporate 1g water

Fig. 2.13

SIO15 2024: Topic 03 - The Solar System

8

4 Ways to Transport Heat

- conduction (energy passed between vibrating atoms)
- radiation (EM waves, no particle movement)
- diffusion (migration of single particles)
- convection (mass transport; MOST EFFECTIVE)

SIO15 2024: Topic 03 - The Solar System

Moon satellite not a planet orbits Earth

Full Moon
New Moon
Lunar Eclipses

11

Change of Tides at a Specific Location

Most places on Earth experience two high tides and two low tides per day (*semi-diurnal tides*).

For example, the tides on October 5, 2007 at the SIO pier looked like the diagram to the right:

Fig. 2.17

Scripps Institution of Oceanography Pier
Tide Predictions
Latitude: 32°52.0'N, Longitude: 117°15.4'W

<http://ocean.peterbrueggeman.com/piertide.html>

A few places experience only one high and one low tide per day (*diurnal tides*).

The tides throughout the day look like this:

SIO15: Chapter 2: Tides

12

The Moon, Sun and Tides at a Specific Location

<http://tidesandcurrents.noaa.gov>

during a synodic month, La Jolla experiences two spring tides and two neap tides.

The period between Full Moons is about 29.5 days (synodic month).

Tidal range:
High-low tide

DART - Double Asteroid Redirection Test

- Launch: Nov 2021 (SpaceX Falcon 9), Vandenberg, CA
- Refrigerator size (372 kg) (NASA)
- Dimorphos, moon of Didymos
- Impact: Mon 9/26/22 (equivalent of 5 tons TNT); 150 m crater analyzed data for next 6 months
- Purpose: deflect Dimorphos/shorten orbit by 73 s
- actual: shortening by 32 min!

ESA follow-up launch of Hera 2024 to arrive 2026

SIO15 2024: Topic 03 - The Solar System

34

DART - Double Asteroid Redirection Test

Challenges:
 Extent of deflection depends on
 Speed
 Impact angle
 Mass/surface density of Dimorphos (very low density/loose pile)

DART
Double Asteroid Redirection Test

Dimorphos: 160 m (4.8B kg, 1km from Didymos)
 Didymos: 780 m, 523B kg

35

Comets

"dirty snowballs"

- icy (frozen volatiles)
- rocky core (few km across)
(Halley comet: 40km)
- sunlight and solar wind
-> comet ejects ionized gases and dust
-> tail

water #1 condition for life to form

LIQUID WATER FOUND ON MARS

BY KENNETH CHANG

Scientists have for the first time confirmed liquid water flowing on the surface of present-day Mars, a finding that will add to speculation that life, if ever around there, could persist now.

"This is tremendously exciting," James Green, the director of NASA's planetary science division, said during a news conference Monday. "We haven't been able to answer this question, 'Does life exist beyond Earth?' But following the water is a critical element of that. We have never found great opportunities in the right location on Mars to thoroughly investigate this."

The results will raise hopes for NASA, where officials have played down the notion that the dusty and forbidding landscape of Mars could be inhabited today.

But now, John Grunsfeld, NASA's associate administrator for science, talked of sending a spacecraft in the 2020s to one of those regions, perhaps with experiments to test Mars' air.

“Mars is not the dry, arid planet that we thought of in the past.”

James Green
director of NASA's
planetary science
division

Finding could have big implications for possibility of microscopic life-forms existing on Earth's next-door neighbor

Surprise! Water Once Flowed on Huge Asteroid Vesta

by Mike Wall, Space.com Senior Writer | January 27, 2015 11:00am ET

Liquid water apparently flowed on the surface of the huge asteroid Vesta briefly in the relatively recent past, a surprising new study suggests.

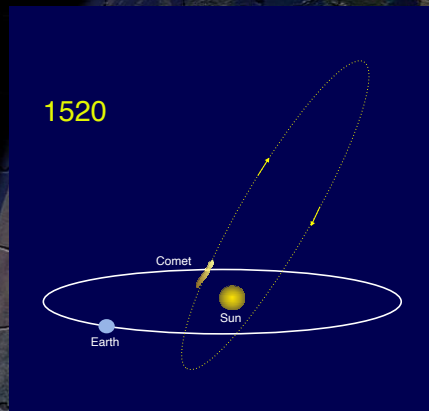

"Nobody expected to find evidence of water on Vesta. The surface is very cold and there is no atmosphere, so any water on the
