

The Two Principal Types of Volcanoes

Shield Volcano

effusive

Mauna Kea, Hawaii

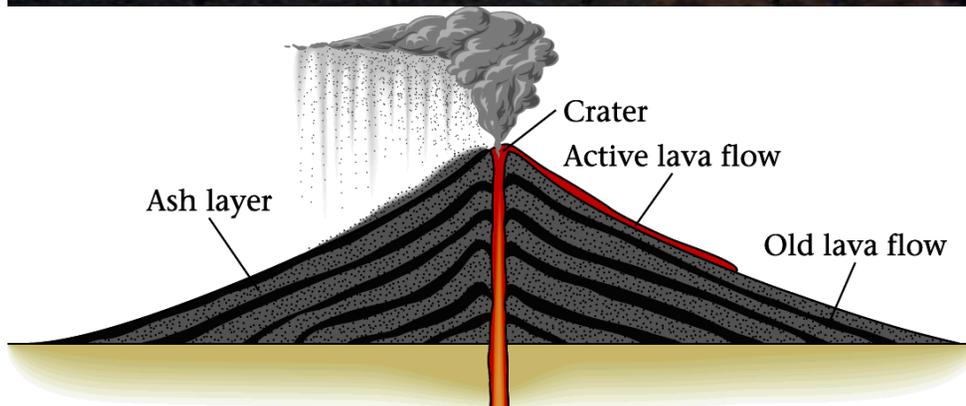

Image: S. Marshak "Earth, Portrait of a Planet"

Hawaii; Etna; Iceland; Erta Ale, Nyamuragira/Africa

Composite Volcano (Stratovolcano)

explosive

Mt. Mayon, Philippines

Fuji; Vesuvius; St. Helens; Pinatubo; Popocatepetl

Examples of Composite Volcanoes

Mt. Mayon, Philippines

Mt. Fuji, Japan

Mt. Rainier

Mt. St. Helens

“...anything that looks beautiful is potentially dangerous...”

Viscosity

Lecture 3: resistance of material to flow

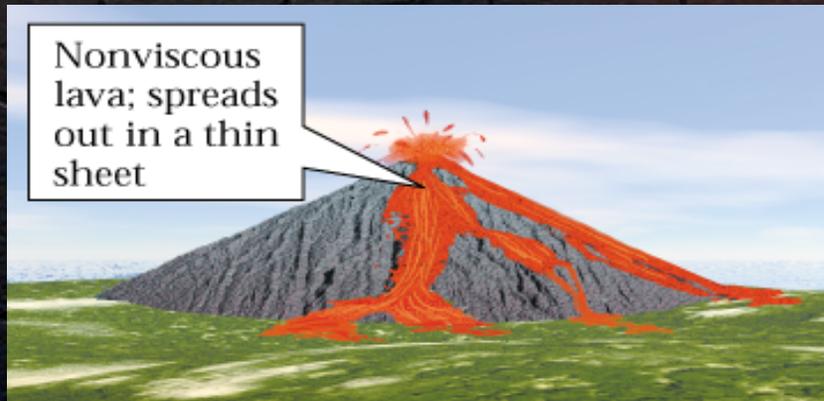

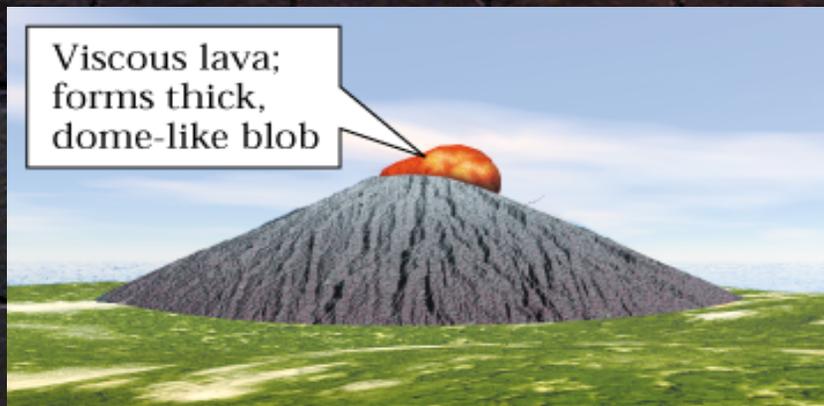

Image: S. Marshak "Earth, Portrait of a Planet"

- high viscosity: lava clogs vents
-> explosive volcanism

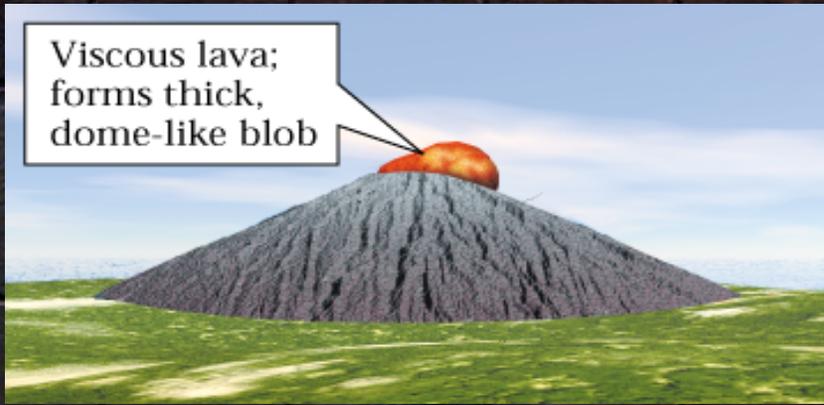

- low viscosity: lava flows easily
-> effusive volcanism

The 2 Main Factors controlling Viscosity

SiO₂ MAKES LAVA MORE VISCOUS

HIGHER TEMPERATURE DECREASES VISCOSITY

Viscous lava; forms thick, dome-like blob

Nonviscous lava; spreads out in a thin sheet

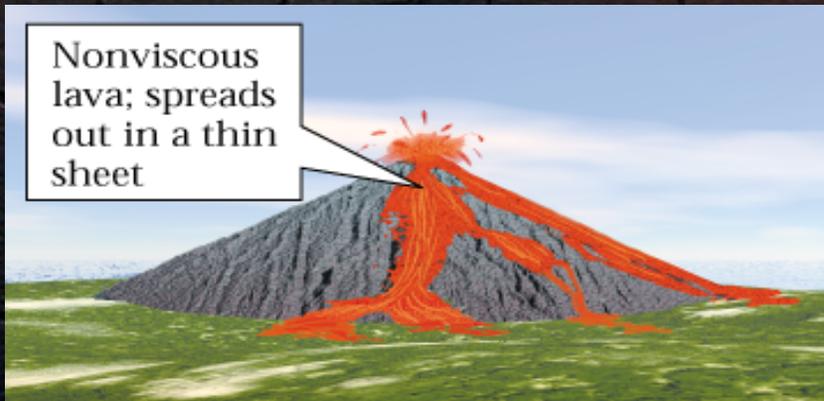

Image: S. Marshak "Earth, Portrait of a Planet"

MORE VISCOUS

- high-SiO₂ (Quartz)
- cold

LESS VISCOUS

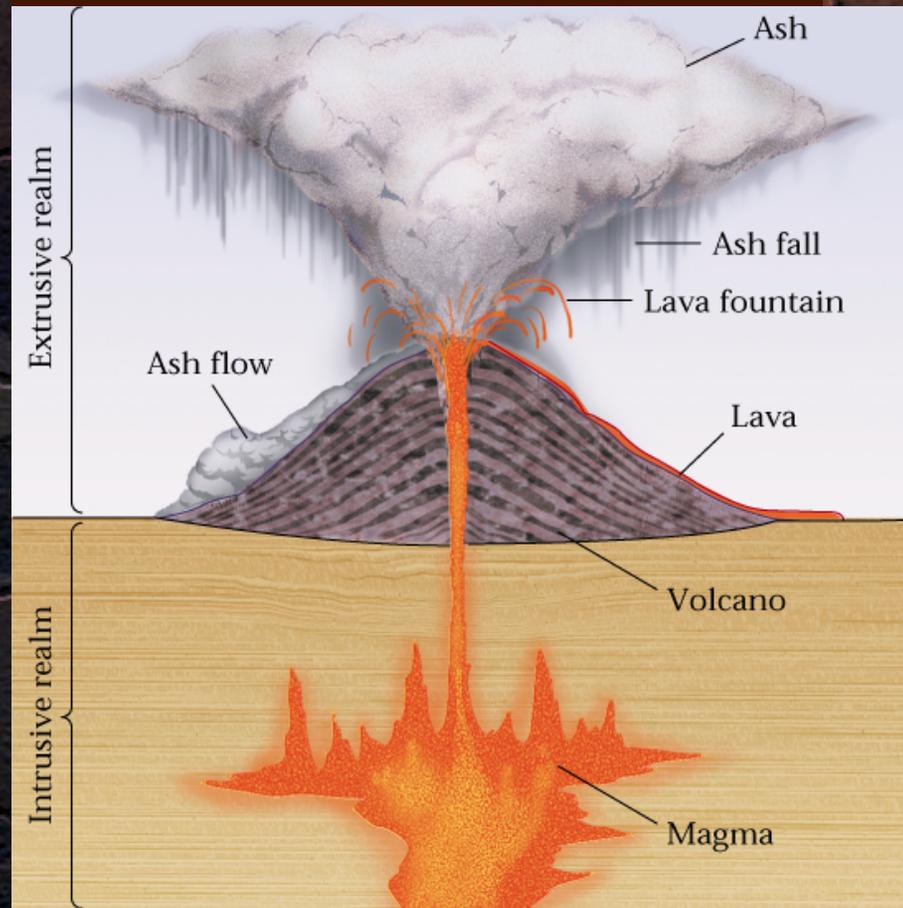

- low-SiO₂ (Olivine)
- hot

SiO₂ = silica

Magma and Lava

Image: S. Marshak "Earth, Portrait of a Planet"

LAVA

- surface
- volcanic
- extrusive

MAGMA

- underground
- plutonic
- intrusive
